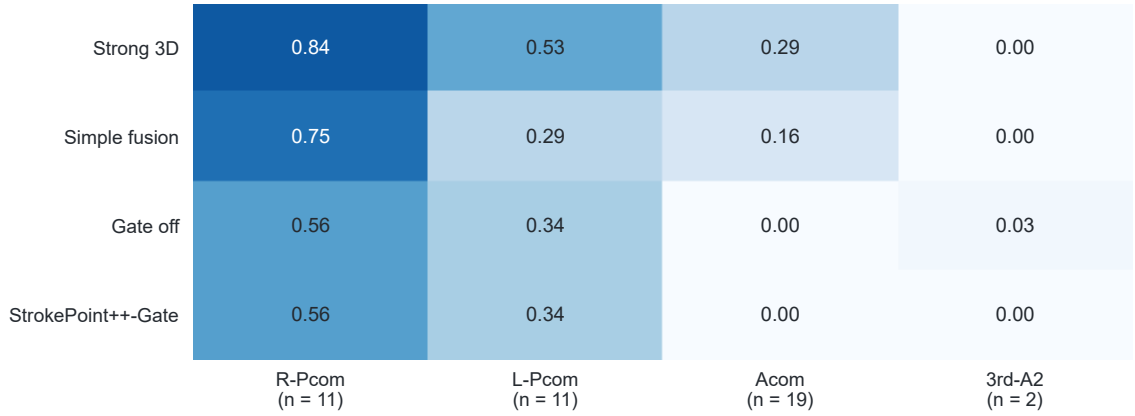
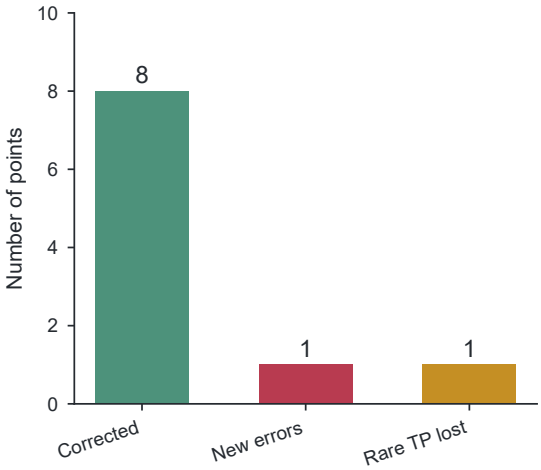
a FINAL rare-vessel point recall



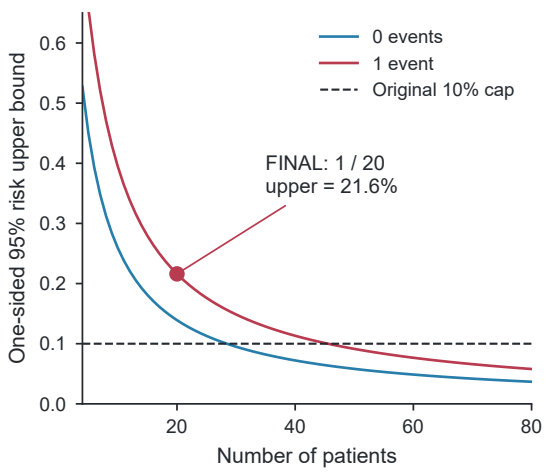
Native-positive patient support

b Gate edits versus its own output



31 modified points across 5 patients
Rare TP loss overlaps the new-error count.

c Patient-event risk precision



d What the present evidence establishes

Application signal

Gate reduces observed false identity presence, with a residual rare-point error.

Unresolved target

Acom identity and third-A2 recovery remain weak. Neither safety nor new-mechanism superiority passed.

No equivalence or safety claim from a zero-crossing interval. Acom negatives n = 1; third-A2 positives n = 2.
